

Title

Plate Deformation Behavior of Polymer Matrix Composite-Ti Honeycomb-Metal Sandwiches for Pressurized Propulsion Component Applications

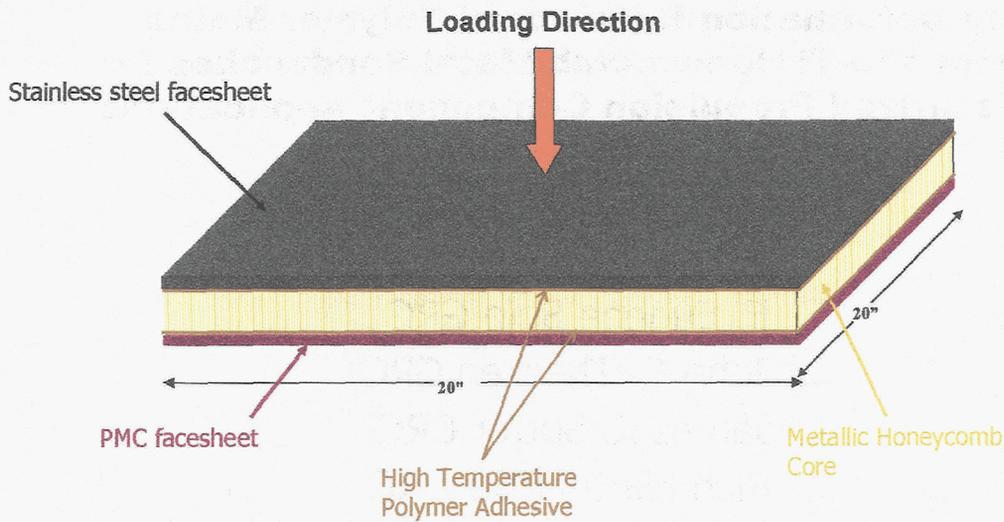

- William D. Bertelsen GBI
- E. Eugene Shin GRC
- John C. Thesken GRC
- James K. Sutter GRC
- Rich Martin CSU-GRC

Objectives

- To experimentally validate bi-axial plate flexural performance of PMC-Ti H/C-A286 sandwich panels for the internally pressurized RBCC combustion chamber support structure
- To explore ASTM 2-D plate flexure test (D 6416) to simulate the internal pressure loading and to correlate the results with analytical and FE modeling based on 2-D flexure properties

Sandwich Panel Configuration

Joint Meetings of ASTM D30 Committee, MIL-HDBK-17, and SAE Committee P17, Oct. 27-31, 2003

3

Experimental

□ Fabrication of sandwich panels

- 1) PMC facesheet fabrication (4HS M40J/PMR-II-50, $[0_f, 90_f]_{1S}$), cured @ 700 °F/25in-Hg/200psi
- 2) Surface treatment of metal f/s and metallic Honeycomb core (Turco etching/Boegel-AM Sol-Gel/Primer); PMC by scotchbrite or grit blast
- 3) Vacuum bagging the sandwich lay-up with high temp adhesive
- 4) Cure at 370°F/22in-Hg/10 psi for 4 hours, remove from vac-bag
- 5) Postcure at 700 °F for 16 hours in air-circulated oven

□ CTE mismatch-induced warpage

Steel-Metallic H/C-PMC sandwich panel: 24"×25"×0.58"

Joint Meetings of ASTM D30 Committee, MIL-HDBK-17, and SAE Committee P17, Oct. 27-31, 2003

4

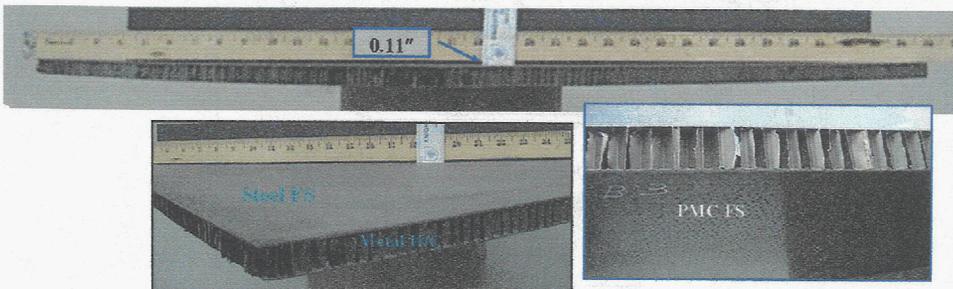

Experimental

- Panel Type I (BLB2): PMC-Metal H/C-PMC for symmetry and to validate the 700°F PI adhesive

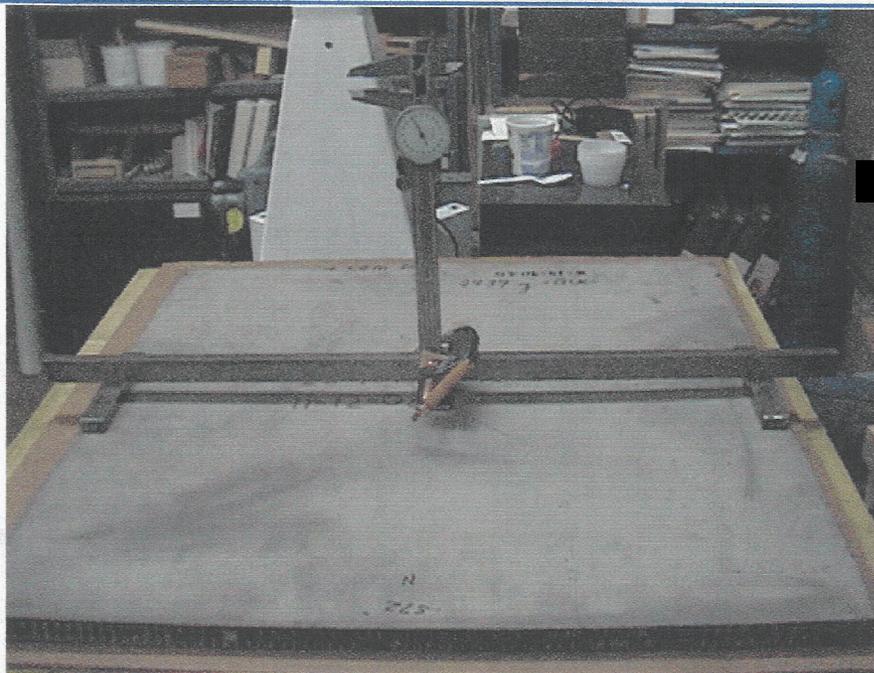

- Panel Type II (BLB3): 140°F Epoxy Bonded Steel-Metal H/C-PMC for minimal warpage and to evaluate overall deformation behavior

Joint Meetings of ASTM D30 Committee, MIL-HDBK-17, and SAE Committee P17, Oct. 27-31, 2003

5

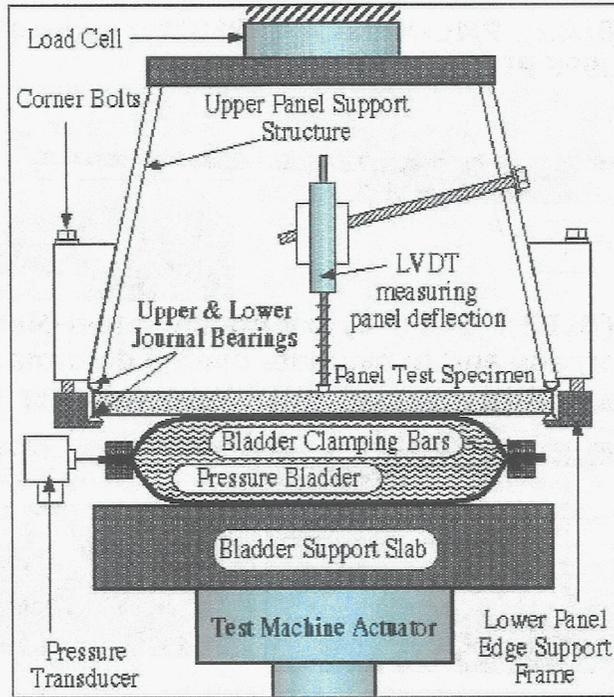

Experimental

Joint Meetings of ASTM D30 Committee, MIL-HDBK-17, and SAE Committee P17, Oct. 27-31, 2003

6

Data Acquisition

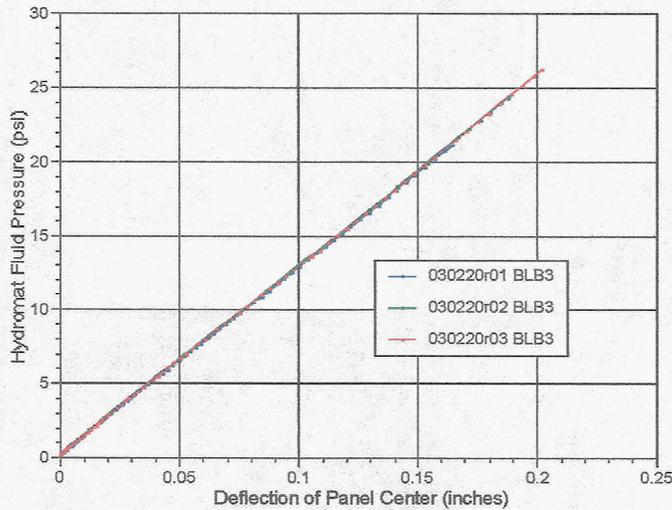

Joint Meetings of ASTM D30 Committee, MIL-HDBK-17, and SAE Committee P17, Oct. 27-31, 2003

22

Static Deflection Data

ASTM D 6416 Hydromat Pressure vs. Deflection
 NASA Panels 0.57" x 20.08" x 20.08", Support Span 500 mm x 500 mm
 Small-Deflection Stiffness Ramps, Stroke Control

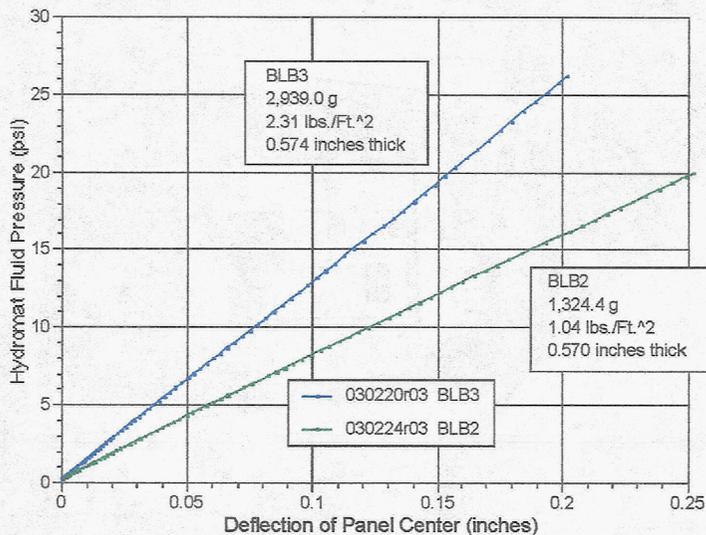

Actuator speed: 0.1 inches per minute. Data sampling interval: 3 seconds. Corner nut torque: 32 inch lbf

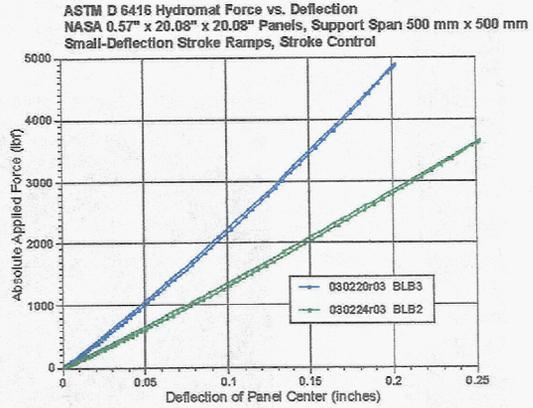

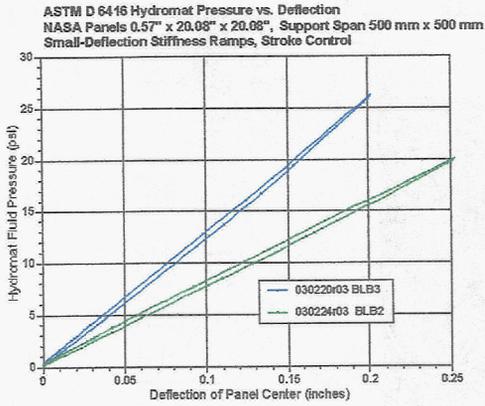

Static Deflection Data

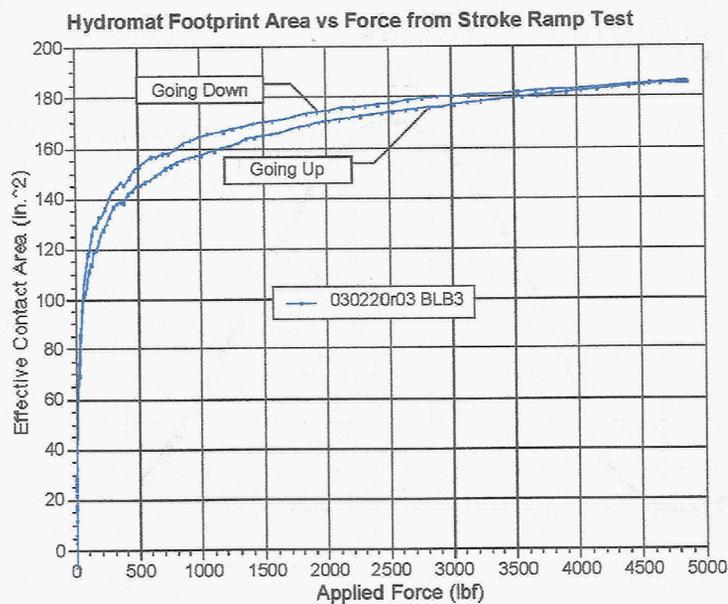

ASTM D 6416 Hydromat Pressure vs. Deflection
 NASA Panels 0.57" x 20.08" x 20.08", Support Span 500 mm x 500 mm
 Small-Deflection Stiffness Ramps, Stroke Control

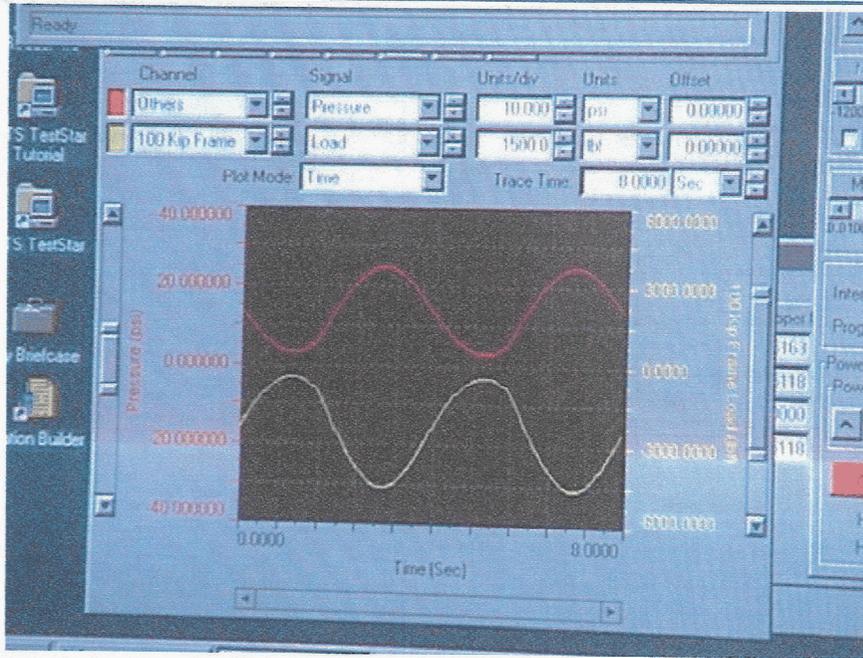

Static Deflection Data

Effective Contact Area

Fatigue Tests

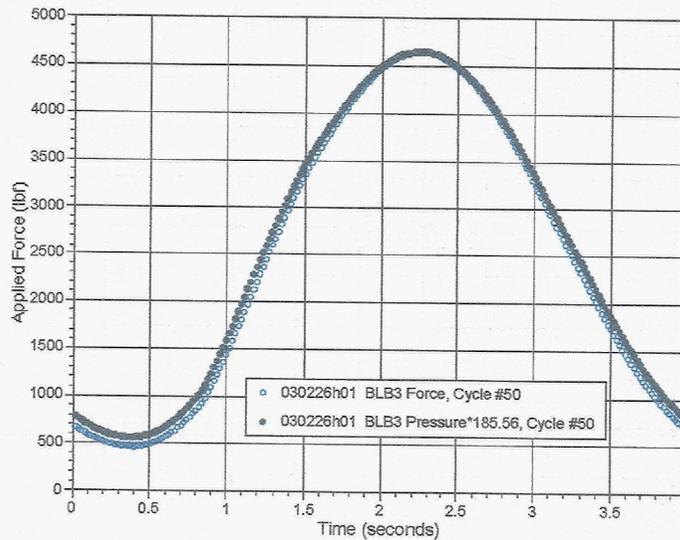

Joint Meetings of ASTM D30 Committee, MIL-HDBK-17, and SAE Committee P17, Oct. 27-31, 2003

27

Fatigue Sinusoid

Hydromat Low-Cycle Fatigue
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load Control, 4,650 lbf Peak, R = 0.1, 0.25 Hz
 Applied Force vs. Time

Data sampling interval: 0.02 seconds

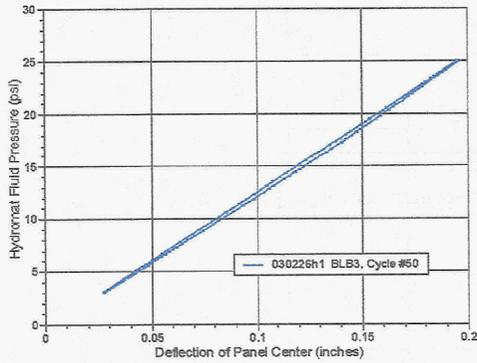

Joint Meetings of ASTM D30 Committee, MIL-HDBK-17, and SAE Committee P17, Oct. 27-31, 2003

28

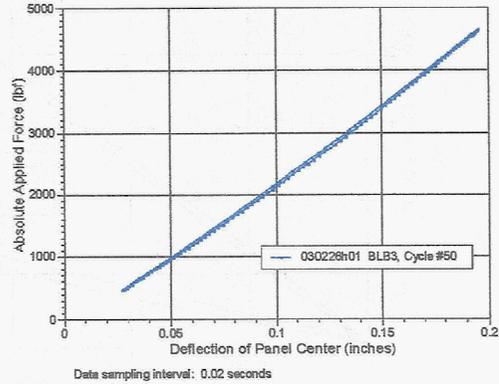

Hysteresis Data

Hydromat Pressure vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load-Controlled Fatigue, 4,650 lbf Peak, R = 0.1, 0.25 Hz

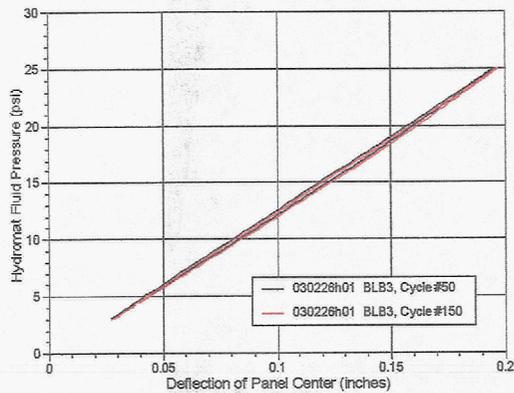

Hydromat Force vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load-Controlled Fatigue, 4,650 lbf Peak, R = 0.1, 0.25 Hz

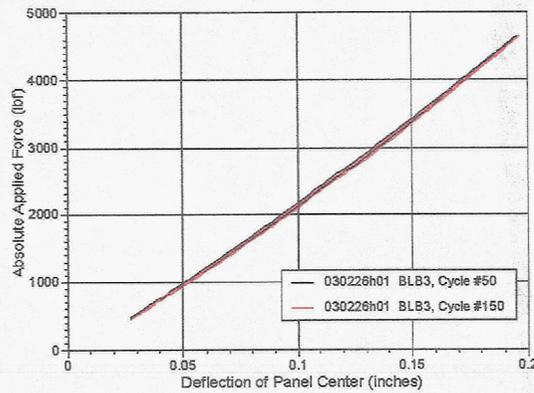

Hysteresis Data

Hydromat Pressure vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load-Controlled Fatigue, 4,650 lbf Peak, R = 0.1, 0.25 Hz

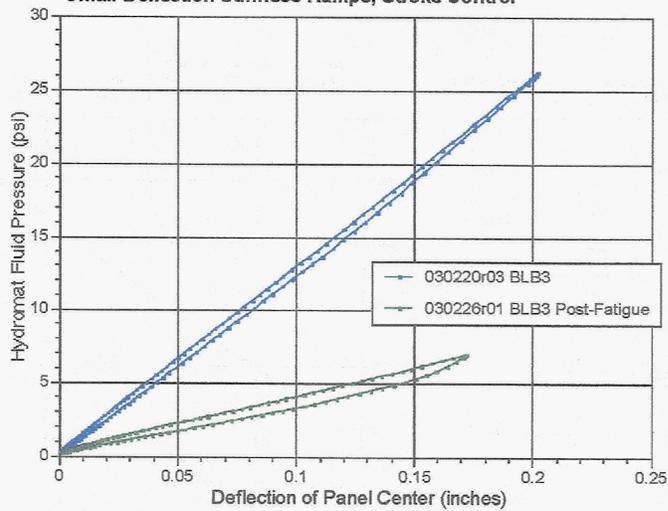

Hydromat Force vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load-Controlled Fatigue, 4,650 lbf Peak, R = 0.1, 0.25 Hz

Residual Stiffness

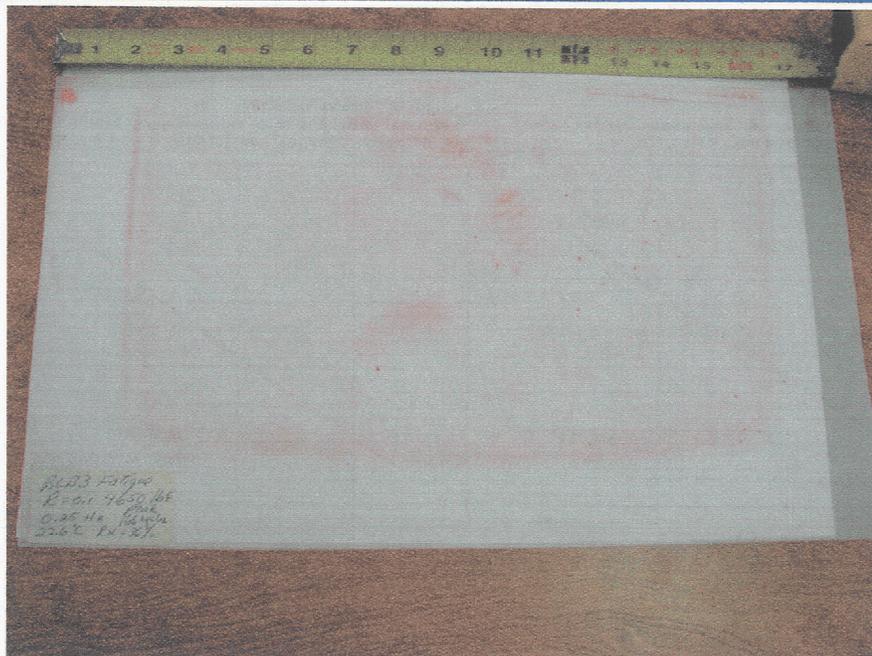

ASTM D 6416 Hydromat Pressure vs. Deflection
NASA Panels 0.57" x 20.08" x 20.08", Support Span 500 mm x 500 mm
Small-Deflection Stiffness Ramps, Stroke Control

Actuator speed: 0.1 inches per minute. Data sampling interval: 3 seconds. Corner nut torque: 32 inch lbf

Fatigue Footprint

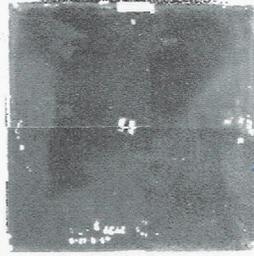

NDE Results

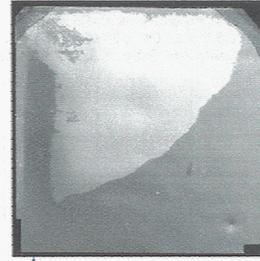

Panel Type II (BLB3)

Loading Side (A286)

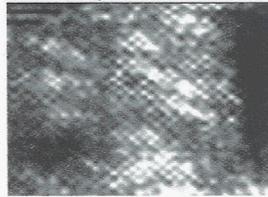

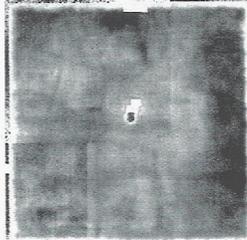

Thermograph

Darker areas indicate skin-core separation

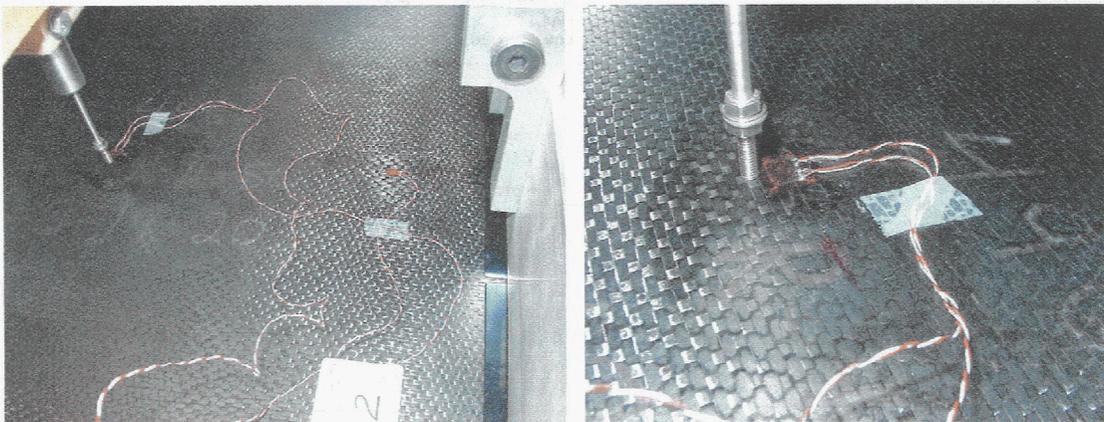

20 MHz Pulse-Echo ultrasonic c-scan; Lighter areas indicate skin-core separation

Tension Side (PMC)

Guided Wave Scan (M0)

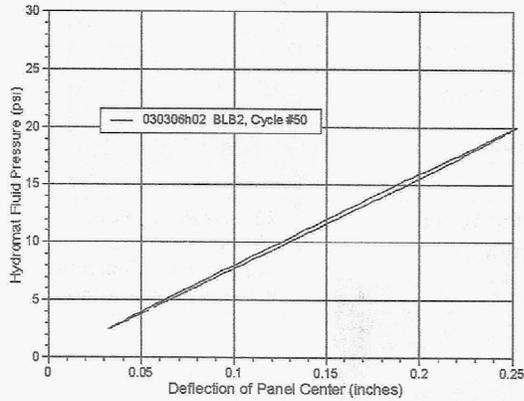

Strain Gaging

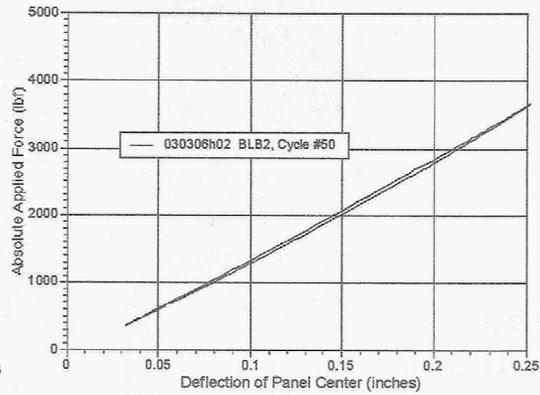

Hysteresis Data

Hydromat Pressure vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load-Controlled Fatigue, 3,670 lbf Peak, R = 0.1, 0.25 Hz

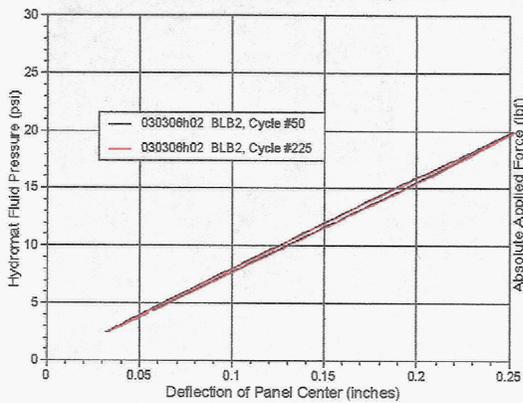

Hydromat Force vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load-Controlled Fatigue, 3,670 lbf Peak, R = 0.1, 0.25 Hz

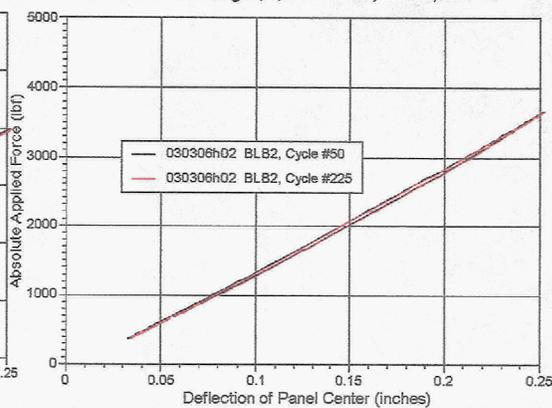

Hysteresis Data

Hydromat Pressure vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load-Controlled Fatigue, 3,670 lbf Peak, R = 0.1, 0.25 Hz

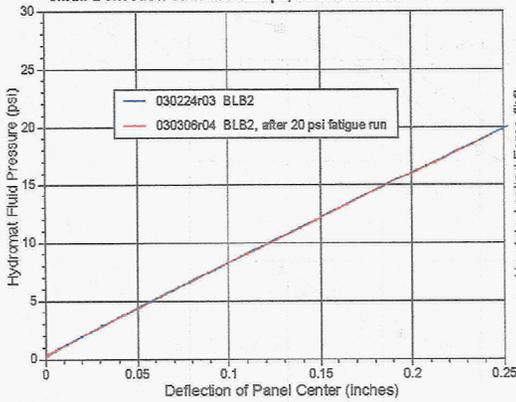

Hydromat Force vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Load-Controlled Fatigue, 3,670 lbf Peak, R = 0.1, 0.25 Hz

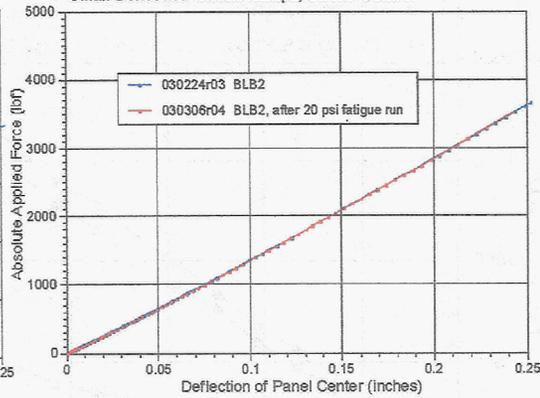

Residual Stiffness

ASTM D 6416 Hydromat Pressure vs. Deflection
 NASA Panels 0.57" x 20.08" x 20.08", Support Span 500 mm x 500 mm
 Small-Deflection Stiffness Ramps, Stroke Control

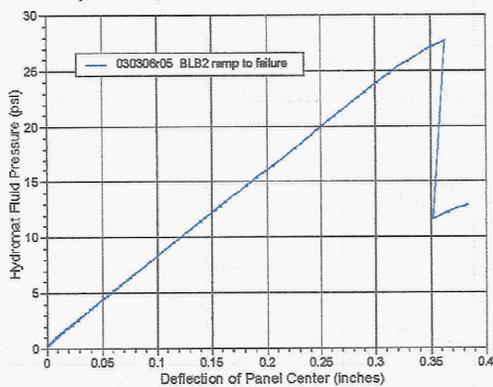

ASTM D 6416 Hydromat Force vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Small-Deflection Stroke Ramps, Stroke Control

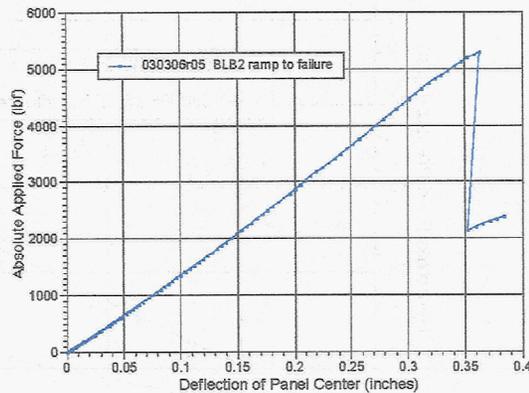

Static Ramp to Failure

ASTM D 6416 Hydromat Pressure vs. Deflection
 NASA Panels 0.57" x 20.08" x 20.08", Support Span 500 mm x 500 mm
 Ramp to Failure, Stroke Control

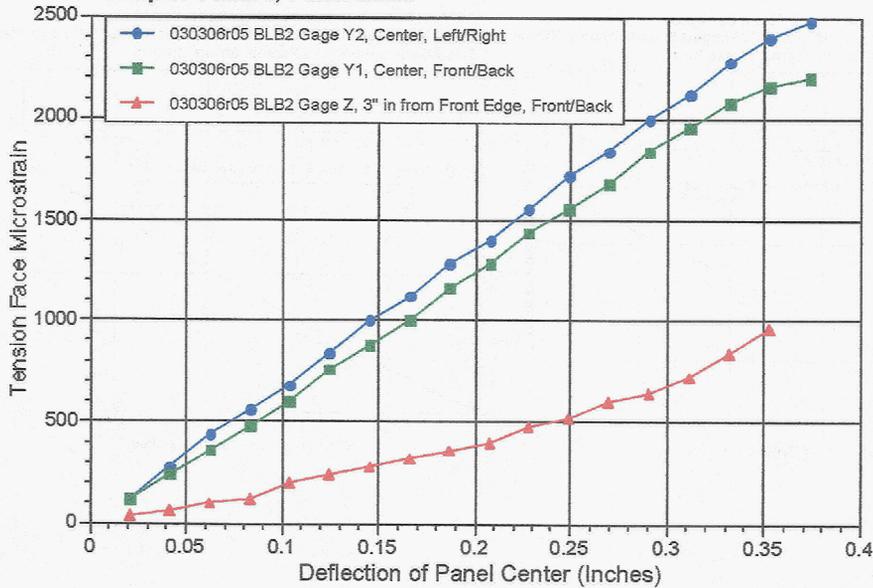

ASTM D 6416 Hydromat Force vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Ramp to Failure, Stroke Control

Static Strain Data

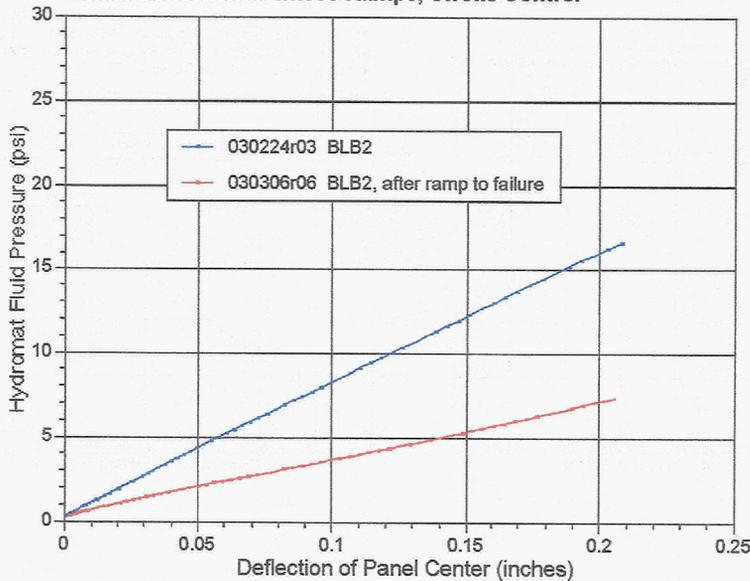

Hydromat Face Strain vs. Deflection
 NASA 0.57" x 20.08" x 20.08" Panels, Support Span 500 mm x 500 mm
 Ramp-to-Failure, Panel BLB2

Residual Stiffness

ASTM D 6416 Hydromat Pressure vs. Deflection
 NASA Panels 0.57" x 20.08" x 20.08", Support Span 500 mm x 500 mm
 Small-Deflection Stiffness Ramps, Stroke Control

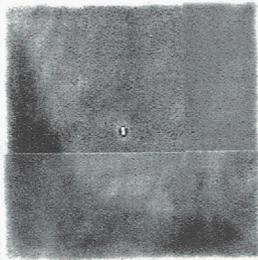

NDE Results

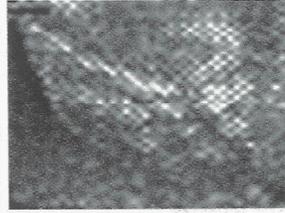

Panel Type I (BLB2)

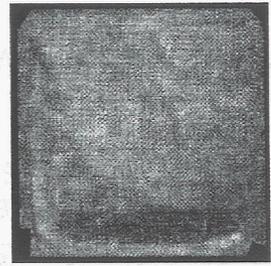

Loading Side

Thermograph

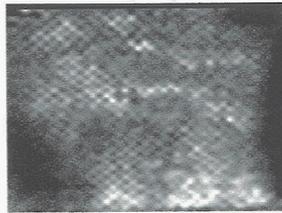

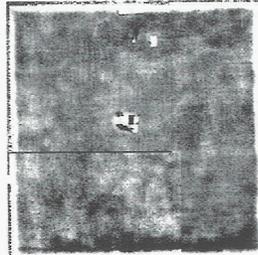

Guided Wave Scan (M0)

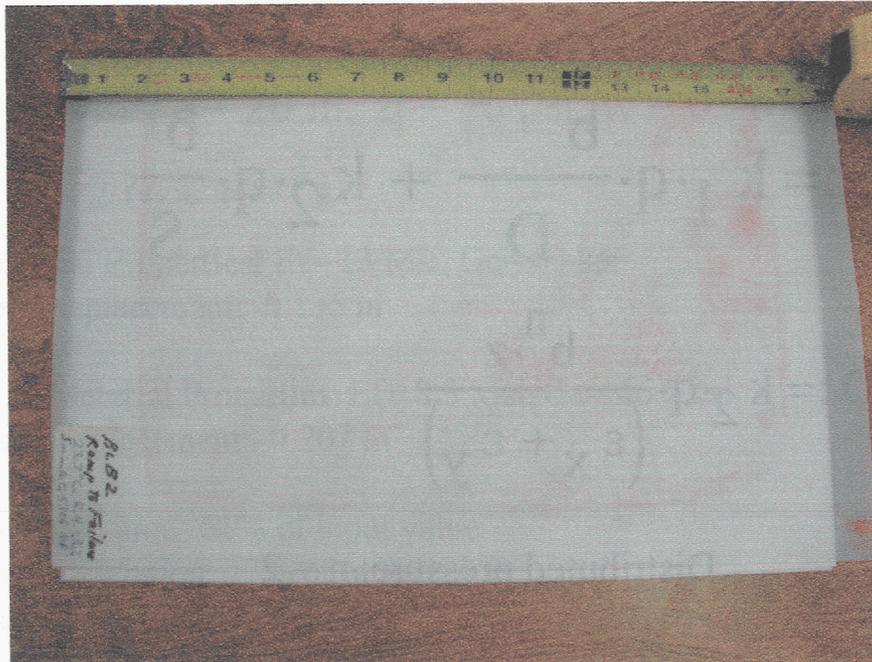

5MHz Pulse-Echo ultrasonic c-scan

Tension Side

Darker areas indicate skin-core separation

Static Footprint

Navier solution for a simply supported panel

$$k_1 := \frac{16}{\pi^6} \left[\sum_m \sum_n \frac{\cos\left(m \cdot \pi \cdot \frac{\phi}{a}\right) \cdot \cos\left(n \cdot \pi \cdot \frac{\phi}{a}\right) \cdot \sin\left(m \cdot \frac{\pi}{2}\right) \cdot \sin\left(n \cdot \frac{\pi}{2}\right)}{m \cdot n \cdot \left(\left(m^2 + n^2\right)\right)^2} \right]$$

$$k_2 := \frac{16}{\pi^4} \left[\sum_m \sum_n \frac{\cos\left(m \cdot \pi \cdot \frac{\phi}{a}\right) \cdot \cos\left(n \cdot \pi \cdot \frac{\phi}{a}\right) \cdot \sin\left(m \cdot \frac{\pi}{2}\right) \cdot \sin\left(n \cdot \frac{\pi}{2}\right)}{m \cdot n \cdot \left(\left(m^2 + n^2\right)\right)} \right]$$

$$n = 1, 3, 5, \dots$$

$$m = 1, 3, 5, \dots$$

$$\phi := \frac{a - \sqrt{A_{\text{eff}}}}{2}$$

Analysis Calibration

$$A_{\text{eff}} = 178 \text{ in}^2, a = 20 \text{ in}, q = 16 \text{ psi}, w = 0.207$$

$$\epsilon_x + \epsilon_y = 2.66 \times 10^{-3}$$

Input Material Properties: $E_f = 13 \text{ Msi}$, $G_c = 60 \text{ ksi}$

Predicted Displacement: 0.135 in

Computed Material Properties: $E_f = 8.3 \text{ Msi}$, $G_c = 46.2 \text{ ksi}$

Measured Displacement: 0.207 in

Face sheet variation: 64% of input value

Honeycomb variation: 77% of input value

Displacement variation: 53% greater than predicted

Experimental Conclusions:

Simulation testing was successful in terms of:

- Test panel preparation
- Test control. ASTM D6416 can be extended to fatigue testing.
- Repeatability

Analysis Conclusions

- Panel Flexural and Shear Stiffness are lower than predicted
- Valuable estimate of the predictive accuracy for sandwich plates
- Sources of discrepancy:
 - ❖ Isotropic Assumption/Sandwich Model
 - ❖ Boundary Conditions
 - ❖ Load Foot Print
